

Journyx & Journyx PX 11.2.0

Version 11.2.0 of Journyx and Journyx PX includes a variety of improvements and new features to make time tracking easier and smarter. With Version 11, Journyx introduced a smarter way to track time with suggested timesheet entries pulled straight from your Microsoft Exchange calendar and tasks. Version 11.2.0 includes continued improvements to automatically fill out your timesheet. It also includes a variety of reporting and data management features that will make your data even more accurate and easy to access.

New Features in Standard and Other Reporting

Journyx added a variety of popular new features to its standard reporting engine in v11.2.0. These new features make reporting options more consistent, data filtering more granular, and information displayed more powerful. These new features are available to all Journyx customers through standard reports.

The User Compliance Report, previously available under the Approvals menu, has been rolled into the standard reporting framework. Moving this one-off report type to standard reports makes available all the configuration, filtering and display options that come with standard reports. The ability to set report run dates, filter and display specific data and save each distinct version of the report is now available for the User Compliance Report.

Other new features in reporting include:

- Additional two fields for display (now up to three) for columns and rows in matrix report types
- New option to set and save report filters by the Journyx Group field
- New option to choose long versus short date format in report output
- One-click export to Excel for rate reports
- New system report for project-activity rates

Other New Features & Improvements

- New option to block users from entering time that exceeds the amount of scheduled work hours assigned to them (Journyx PX only)
- New option to copy project-activity rates from a parent project to its child projects/tasks
- New option to choose if sheet approval submission notices are sent for open sheets, prior period corrections, or both
- New options to tie in to the Suggestions feature using API keys and a Zapier prototype ([Zapier](#) beta testing for Google Calendar will be available in Journyx/PX v11.5.0)
